SVM1

What is the connection between soft-margin SVM and logistic regression? CSUULOTCS Problem 1:

The soft-margin SVM is defined via the minimization problem

minimiz Assignment Project Exam Help

subject to $y_i(\mathbf{w}^T \mathbf{x}_i + b) - 1 + \xi_i \ge 0$

Due to the complementary stackness conditions, we have $0.163.com^{i=1,...,N}$.

$$\alpha_i \left(y_i(\boldsymbol{w}^T \boldsymbol{x}_i + b) - 1 + \xi_i \right) = 0.$$

Thus, for points that $\xi_i = 1 - y_i(w^T x_i + b)$. Otherwise, ξ_i is minimized and therefore 0. In other words,

$$\xi_i = \begin{cases} 1 - y_i(\boldsymbol{w}^T \boldsymbol{x}_i + b) & \text{if } y_i(\boldsymbol{w}^T \boldsymbol{x}_i + b) < 1, \\ 0 & \text{https:} / \text{tutoics.} \\ \end{cases} (0.1 - y_i(\boldsymbol{w}^T \boldsymbol{x}_i + b)) = \text{Hinge}(y_i(\boldsymbol{w}^T \boldsymbol{x}_i + b)).$$

Dividing by C, the error (or loss) function is

$$E(\boldsymbol{w}, b, C) = \underbrace{\frac{1}{2C}}_{N} \boldsymbol{w}^{T} \boldsymbol{w} + \sum_{i=1}^{N} \text{Hinge}(y_{i}(\boldsymbol{w}^{T} \boldsymbol{x}_{i} + b))$$
(1)

Applying logistic regression to the same classification problem, we have

$$p(y_i = 1 | x_i, w) = \sigma(w^T x_i + b),$$

 $p(y_i = -1 | x_i, w) = \sigma(-(w^T x_i + b)) = 1 - \sigma(w^T x_i + b),$

where the last equality holds due to the definition of the sigmoid function, $\sigma(z) = \frac{1}{1+e^{-z}}$. Keep in mind that in this case $y_i \in \{-1,1\}$ and not $\{0,1\}$ as we used originally. Altogether, we have

$$p(y|X, w) = \prod_{i=1}^{N} \sigma(y_i(w^T x_i + b)).$$

Upload a single PDF file with your homework solution to Moodle by 22.12.2021, 23:59pm CET. We recommend to typeset your solution (using LATEX or Word), but handwritten solutions are also accepted. If your handwritten solution is illegible, it won't be graded and you waive your right to dispute that.

We use the negative logicalistic for further i.e. CS编程辅导

$$E(w,b) = -\ln(\frac{|w|}{|w|} + \frac{|w|}{|w|} + \frac{$$

tion term and get

Additionally, we introd

Hence, we see the close relationship between the soft-margin SVM (Eq. 1) and logistic regression (Eq. 2). While soft-margin SVM uses the hinge function for its loss, logistic regression uses $\ln(1+e^{-x})$. For better comparison, we can plot these two (with logistic regression rescaled by $\frac{1}{\ln 2}$):

Log. regression

Email: tutores @, 163 com

Problem 2: Consider a O(1) Consider a O(1) Consider a O(1) Consider a O(1) Separable dataset O(1) using the Hinge loss formulation of the optimization task.

- a) Is it guaranteed that all training samples in \mathcal{D} will be assigned the correct label by the model?
- b) Prove that if for some $C_0 \ge 0$ the resulting model classifies all training samples correctly and all samples lie outside of the margin then it will also be the case if we train the model with any larger $C > C_0$.
 - a) No, as it might happen that misclassifying a few points that are very close to the decision boundary would lead to a significantly increasing the margin. In general, larger values of C make this behavior less likely.
 - b) Denote by $h(w, b) = \sum_{i=1}^{N} \max (0, 1 y_i(w^T x_i + b))$ the overall Hinge loss and let $C > C_0 \ge 0$ be as in the task formulation. Note that the hyperplane defined by w and b assigns the correct labels to all samples such that all of them also lie outside of the margin if and only if h(w, b) = 0.

We also define th起来原航或局域的 CS编程辅导

$$(w^*, b^*) = \arg\min_{w,b} \quad \frac{1}{2} w^T w + C_0 h(w, b)$$
 and
$$\min_{w,b} \quad \frac{1}{2} w^T w + C h(w, b).$$

Then the following the sequence of these points:

$$(w^*, b^*) \le \frac{1}{2} ||v^*||^2 + C_0 h(v^*, d^*),$$

$$\frac{1}{2} ||v^*||^2 + Ch(v^*, d^*) \le \frac{1}{2} ||w^*||^2 + Ch(w^*, b^*).$$

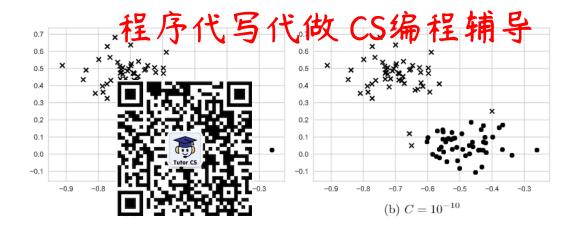

Summing the left and Eght transite of these inequalities we get

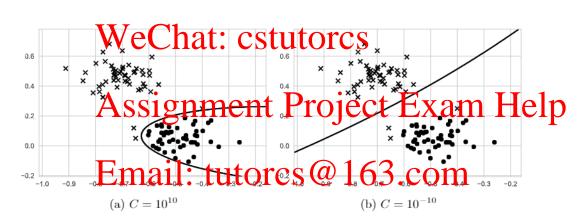

$$\begin{array}{c} \frac{1}{2} \| \boldsymbol{w}^* \|^2 + \frac{1}{2} \| \boldsymbol{v}^* \|^2 + C_0 h(\boldsymbol{w}^*, b^*) + C h(\boldsymbol{v}^*, d^*) \leq \frac{1}{2} \| \boldsymbol{v}^* \|^2 + \frac{1}{2} \| \boldsymbol{w}^* \|^2 + C_0 h(\boldsymbol{v}^*, d^*) + C h(\boldsymbol{w}^*, b^*) \\ & \text{Assignment Project Exam Help} \\ (C - C_0)(h(\boldsymbol{v}^*, d^*) - h(\boldsymbol{w}^*, b^*)) \leq 0 \quad \text{and since } C - C_0 > 0 \end{array}$$

Email: tutorcs@163.com

That means the overall Hinge loss decreases for the optimal solution if we solve the SVM fitting problem with a larger value of G. Since we could separate the data perfectly (with no points within the margin) with the solution (w^*, b^*) for C we have $h(w^*, b^*) = 0$. As shown above the Hinge loss can not get worse for larger C, hence also $h(v^*, d^*)$ has to be 0 and the solution (v^*, d^*) also corresponds to a decision boundary with no error on training data and no points lying inside the margin S://tutorcs.com

Problem 3: Sketch the decision boundary of an SVM with a quadratic kernel (polynomial with degree 2) for the data in the figure below, for two specified values of the penalty parameter C. The two classes are denoted as \bullet 's and \times 's.

- a) With such a large polary SVM viller 8 Occepts all of the instances in the training set
- b) Given the small penalty, we can allow few misclassified instances, and obtain a larger margin between the two classes.

https://tutores.com

2 Kernels

Problem 4: Consider the Gaussian kernel

$$k_{ ext{G}}(x_1,x_2) = \exp\left(-rac{\|x_1-x_2\|^2}{2\sigma^2}
ight), ext{ with } x_1,x_2 \in \mathbb{R}^d\,.$$

a) Suppose you have found a feature map $\theta : \mathbb{R}^d \to \mathbb{R}^{d_1}$ that transforms your data into a feature space in which a SVM with a Gaussian kernel works well. However, computing $\theta(x)$ is computationally expensive and luckily you discover an efficient method to compute the scalar product

$$k(\mathbf{x}_1, \mathbf{x}_2) = \theta(\mathbf{x}_1)^T \theta(\mathbf{x}_2)$$

in your feature space without having to compute $\theta(x_1)$ and $\theta(x_2)$ explicitly. Show how you can use the scalar product $k(x_1, x_2)$ to efficiently compute the Gaussian kernel $k_G(\theta(x_1), \theta(x_2))$ in your feature space.

Upload a single PDF file with your homework solution to Moodle by 22.12.2021, 23:59pm CET. We recommend to typeset your solution (using LATEX or Word), but handwritten solutions are also accepted. If your handwritten solution is illegible, it won't be graded and you waive your right to dispute that.

b) One of the nice third about keriels that her barnes can be constructed already given ones. Use the five keriel construction rules from the lecture to prove that keries a kernel.

Hint: Use the Taylor expansion of the exponential function to prove that $\exp \circ k_1$ is a kernel if k_1 with the linear kernel $k_2(x_1,x_2)=x_1^Tx_2$ and a feature is a kernel. Also, a $map \ \phi \ with \ only \ or$

- c) Can any finite set 📑 separated in the feature space of the Gaussian kernel if σ can be chosen freel.
 - a) By expanding th **L** applying the definition of $k(x_1, x_2)$ we get

$$k_{G}(\theta(x_{1}), \theta(x_{2})) = \exp\left(-\frac{\|\theta(x_{1}) - \theta(x_{2})\|^{2}}{2\sigma^{2}}\right)$$

$$\mathbf{WeCha(:} \underbrace{\mathbf{Cstuto_{xcs}}}_{\mathbf{Cstuto_{xcs}}})$$

$$= \exp\left(-\frac{\theta(x_{1})^{T}\theta(x_{1}) - 2\theta(x_{1})^{T}\theta(x_{2}) + \theta(x_{2})^{T}\theta(x_{2})}{2\sigma^{2}}\right)$$

$$\mathbf{Assignment_{1}Project}_{\mathbf{z}\sigma^{2}}k_{\mathbf{L}}\mathbf{Exam} \ \mathbf{Help}$$

Thus we can compute $k_G(\theta(x_1), \theta(x_2))$ from $k(x_1, x_2)$ using the above equation.

b) First we prove that $\exp(k(x_1, x_2))$ is a kernel if $k(x_1, x_2)$ is a kernel. The Taylor expansion of the exponential function is

QQ:
$$e^{7}$$
 $_{2}$ $_{3}$ $_{2}$ $_{3}$ $_{2}$ $_{3}$ $_{4}$ $_{1}$ $_{1}$ $_{1}$ $_{2}$ $_{1}$ $_{1}$ $_{2}$ $_{3}$ $_{4}$ $_{5}$ $_{1}$ $_{1}$ $_{2}$ $_{3}$ $_{4}$ $_{5}$ $_{1}$ $_{2}$ $_{3}$ $_{4}$ $_{5}$ $_{5}$ $_{1}$ $_{1}$ $_{2}$ $_{3}$ $_{4}$ $_{5}$ $_{5}$ $_{6}$ $_{1}$ $_{1}$ $_{2}$ $_{3}$ $_{4}$ $_{5}$ $_{5}$ $_{6}$ $_{7}$ $_{1}$ $_{1}$ $_{2}$ $_{3}$ $_{4}$ $_{5}$ $_{5}$ $_{6}$ $_{7}$ $_{1}$ $_{1}$ $_{2}$ $_{3}$ $_{4}$ $_{5}$ $_{5}$ $_{6}$ $_{7}$ $_{7}$ $_{7}$ $_{7}$ $_{8}$ $_{8}$ $_{9}$ $_{1}$ $_{1}$ $_{2}$ $_{3}$ $_{1}$ $_{2}$ $_{3}$ $_{3}$ $_{4}$ $_{5}$ $_{1}$ $_{2}$ $_{3}$ $_{3}$ $_{4}$ $_{5}$ $_{5}$ $_{6}$ $_{7}$ $_{7}$ $_{7}$ $_{8}$ $_{7}$ $_{8}$ $_{7}$ $_{8}$ $_{8}$ $_{9}$ $_{1}$ $_{1}$ $_{1}$ $_{2}$ $_{3}$ $_{1}$ $_{2}$ $_{3}$ $_{3}$ $_{4}$ $_{5}$ $_{5}$ $_{7}$ $_{7}$ $_{8}$ $_{7}$ $_{8}$ $_{8}$ $_{8}$ $_{9}$ $_{1}$ $_{1}$ $_{1}$ $_{2}$ $_{3}$ $_{3}$ $_{4}$ $_{2}$ $_{3}$ $_{4}$ $_{5}$ $_{4}$ $_{5}$ $_{5}$ $_{5}$ $_{7}$ $_{7}$ $_{8}$ $_{8}$ $_{7}$ $_{8}$ $_{8}$ $_{9}$ $_{1}$ $_{8}$ $_{1}$ $_{8}$ $_{1}$ $_{1}$ $_{1}$ $_{1}$ $_{1}$ $_{2}$ $_{3}$ $_{1}$ $_{3}$ $_{4}$ $_{1}$ $_{2}$ $_{3}$ $_{4}$

The power $k(x_1,x_2)^n$ is a kernel by iterated application of rule 3 $(k_1(x_1,x_2)k_2(x_1,x_2))$ is a kernel). The property of the $N \in \mathbb{N}$ by iterated application of rule 1 $(k_1(x_1, x_2) + k_2(x_1, x_2))$ is a kernel). Therefore, the pointwise limit of kernels

$$\sum_{n=1}^{\infty} \frac{1}{n!} k(x_1, x_2)^n = \lim_{N \to \infty} \sum_{n=1}^{N} \frac{1}{n!} k(x_1, x_2)^n$$

is again a kernel. The constant 1 is a kernel by rule 4: $k_3(\phi(x_1), \phi(x_2))$ with $k_3(x_1, x_2) = x_1^T x_2$ and $\phi(z) = 1$. Thus $1 + \sum_{n=1}^{\infty} \frac{1}{n!} k(x_1, x_2)^n$ is a kernel by rule 1.

We expand the argument of the exponential function,

$$\begin{split} \exp\!\left(-\frac{\|x_1 - x_2\|^2}{2\sigma^2}\right) &= \exp\!\left(-\frac{(x_1 - x_2)^T(x_1 - x_2)}{2\sigma^2}\right) = \exp\!\left(-\frac{x_1^T x_1 - 2x_1^T x_2 + x_2^T x_2}{2\sigma^2}\right) \\ &= \exp\!\left(-\frac{x_1^T x_1}{2\sigma^2}\right) \exp\!\left(-\frac{x_2^T x_2}{2\sigma^2}\right) \exp\!\left(\frac{x_1^T x_2}{\sigma^2}\right) \,. \end{split}$$

Consider the last T first. The scalar product $x_1^T C S$ the new kernel by rule 2 the product $x_1^T x_2/\sigma^2$ is a kernel because σ^2 is positive. As proved above the term $\exp(x_1^T x_2/\sigma^2)$ is then a kernel as well.

The product of the p

Finally, by rule 3 *** a kernel.

b) Consider the lim

$$k_G(x_1, x_2; \sigma) \xrightarrow{\mathbf{r} \to 0} k(x_1, x_2) = \begin{cases} 1 & \text{if } x_1 = x_2 \\ 0 & \text{if } x_1 \neq x_2 \end{cases}.$$

All training samples are conditionally classified if the conditional $y_i(\mathbf{w}^T\phi_{\mathbf{G}}(\mathbf{x}_i) + b) > 0$ for all i.

We will construct a classifier with the desired property by using the dual representation of $w = \sum_j y_j \alpha_j \phi_G(x_j)$ Sisting the above expression and realizing the scalar poliuct $\phi_G(x_i)^T \phi_G(x_j)$ by the kernel function $k_G(x_i, x_j; \sigma)$ we get the same condition in the following form

Email: (tutores,@463.com

Using the limit kernel function k in particular we can see that the left hand side will converge to Q: 749389476 $y_i^2\alpha_i + y_i b$

for small σ . By choosing b=0 we see that the resulting condition is fulfilled for all training samples, since $y_i^2 = 1$ for all i and we can simply set all $\sigma = 0$ (note, that this means that every sample is a support vector in this case). Hence all finite sets of points can be linearly separated using the Gaussian kernel if the variance σ is chosen small enough.

Problem 5: Let $\mathcal{M} = \bigcup_{n \in \mathbb{N}} \bigcup_{m \in \mathbb{N}} \mathbb{R}^{n \times m}$ denote the set of all real-valued matrices of arbitrary size. Prove that the function $k : \mathcal{M} \times \mathcal{M} \to \mathbb{R}$ is a valid kernel, where

$$k(\boldsymbol{X},\boldsymbol{Y}) = \min(\mathrm{rank}(\boldsymbol{X}),\mathrm{rank}(\boldsymbol{Y}))\,.$$

We will prove it by constructing the corresponding feature map. Consider the function

$$\phi(X) = (\underbrace{1, 1, 1, \dots, 1}_{\text{rank}(X) \text{ ones}}, \underbrace{0, 0, 0, 0, 0, 0, 0, 0, \dots}_{\text{zeros everywhere else}}).$$

Then $\phi(X)^T \phi(Y) = \sum_{j=1}^{\infty} \phi_j(X) \phi_j(Y) = \min(\operatorname{rank}(X), \operatorname{rank}(Y)) = k(X, Y)$ is the inner product. Hence, k(X, Y) is a valid kernel.

Both supervised class SVM also tries to maxiabout separation.

erences between the SVM and perceptron algorithms. How o they differ?

rate two classes by a hyperplane. The difference is that een the hyperplane and data, while perceptron only cares

Problem 7: Recall that the dual function in the setting of the SVM training task (Slide 17) can be written as $g(\alpha) = \frac{1}{2} \alpha^T Q \alpha + \alpha^T \mathbf{1}_N.$

$$g(\alpha) = \frac{1}{2} \alpha^T Q \alpha + \alpha^T \mathbf{1}_N.$$

- product or Schur product).
- (b) Prove that we can search for a local maximizer of g to find its global maximum (don't forget to prove properties of the at lecifety to meth (a). 63.0011
- (a) Recall that the dual function g is

QQ:
$$749389476_{g(\alpha)} = \sum_{i=1}^{N} \alpha_i - \frac{1}{2} \sum_{i=1}^{N} \sum_{j=1}^{N} \alpha_i y_i y_j x_i^T x_j \alpha_j$$

and on the other lattps://tutorcs.com

$$\frac{1}{2}\alpha^T Q \alpha + \alpha^T \mathbf{1}_N = \sum_{i=1}^N \alpha_i + \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^N \alpha_i Q_{ij} \alpha_j$$

meaning that $Q_{ij} = -y_i y_j x_i^T x_j$. From that we see that Q can be decomposed as (-1 times)the element-wise product of two matrices A and B with $A_{ij} = y_i y_j$ and $B_{ij} = x_i^T x_j$ so that

$$A = \begin{pmatrix} y_1 y_1 & y_1 y_2 & \cdots & y_1 y_N \\ y_2 y_1 & y_2 y_2 & \cdots & y_2 y_N \\ \vdots & \vdots & & \vdots \\ y_N y_1 & y_N y_2 & \cdots & y_N y_N \end{pmatrix} = y y^T \text{ and } B = \begin{pmatrix} x_1^T x_1 & x_1^T x_2 & \cdots & x_1^T x_N \\ x_2^T x_1 & x_2^T x_2 & \cdots & x_2^T x_N \\ \vdots & \vdots & & \vdots \\ x_N^T x_1 & x_N^T x_2 & \cdots & x_N^T x_N \end{pmatrix} = X X^T.$$

Finally, we get $Q = -yy^T \odot XX^T$.

(b) We will first show the ATALLYSS KATON OS TO STREET HE matrix by definition. For that consider an arbitrary $\alpha \in \mathbb{R}^N$ and

$$\alpha^T \big(A \odot B \big) \alpha = \sum_i \sum_{i=1}^N \sum_{\text{Tutor CS}} \sum_{i=1}^N x_i y_i x_i \Big)^T \left(\sum_{j=1}^N \alpha_j y_j x_j \right) = \left\| \sum_{i=1}^N \alpha_i y_i x_i \right\|^2 \geq 0 \ .$$

 $A \odot B$ is negative semi-definite. This means that the As $A \odot B$ is PSD function q is concave, thus every local maximum is a global maximum.

Problem 8: Consider training set of N samples. Let s denote the number of support vectors we would obtain if we would train on the entire dataset. Furthermore, let ε denote the leave-one-out cross validation (LOOCV) misclassification rate. Prove that the following relation holds:

Assignment Project Exam Help

Intuitively, the result follows from the following claim (which we prove below): if x_i is not a support vector when training destinating training to the Steep in 3 * and 170 not change when leaving x_i out of the training set.

Since the original data are linearly separable and since we are using a hard-margin classifier, the hypothesis given by the original w and w and w are w and w error on x_i , and hence, no error will be made in the i-th step of the LOOCV. Equivalently, the only possible errors in the LOOCV procedure are made on x_i 's which are support vectors when training on the entire training set, and hence $\varepsilon \leq \frac{s}{N}$.

(The following details are not required for full points). Formally, let $(w_{\mathcal{D}}^*, b_{\mathcal{D}}^*)$ and $\mathbf{c}_{\mathcal{D}}^*$ denote the optimal primal and dual solutions for the SVM when training on the entire \mathcal{D} . Also let, $\mathcal{D}_i = \mathcal{D} \setminus \{(x_i, y_i)\}$ be the set of training examples when omitting the i-th example, and let $(w_{\mathcal{D}_i}^*, b_{\mathcal{D}_i}^*)$ and $\alpha_{\mathcal{D}_i}^*$ be the optimal primal and dual variables of the optimization problem when training on \mathcal{D}_i .

 $\alpha_{\mathcal{D}_i}$ consists of only n-1 variables, namely $\alpha_{\mathcal{D}_i,1},\ldots,\alpha_{\mathcal{D}_i,i-1},\alpha_{\mathcal{D}_i,i+1},\ldots,\alpha_{\mathcal{D}_i,N}$. Now consider setting the dual variables as follows $\alpha_{\mathcal{D}_i,j} = \alpha_{\mathcal{D},j}^*$ for $j \neq i$. Note that, if x_i is not a support vector when training on \mathcal{D} then $\alpha_{\mathcal{D},i}^* = 0$. We can verify that $(w_{\mathcal{D}}^*, b_{\mathcal{D}}^*)$ and $\alpha_{\mathcal{D}_i}$ satisfy the KKT conditions for the SVM optimization problem when training on \mathcal{D}_i (e.g. the condition regarding the derivatives of the Lagrangian with respect to the primal variables is guaranteed to hold by our construction). From this, and the fact that $w_{\mathcal{D}}^*$, $b_{\mathcal{D}}^*$ are unique since the objective function is strictly convex we can conclude that w^* , b^* do not change when omitting $\{(x_i, y_i)\}$ as desired.

Problem 9: Load the notebook exercise_09_notebook.ipynb from Moodle. Fill in the missing code and run the notebook. Convert the evaluated notebook to pdf and add it to the printout of your homework.

4 Kernels

Problem 10: Show that 0 for i = 0, ..., N the following function k is a valid kernel.

$$\mathbf{WeCh}^{k(x_1,x_2)} = \sum_{i=1}^{N} a_i (x_1^T x_2)^i + a_0, \text{ with } x_1, x_2 \in \mathbb{R}^d.$$

The function $k_l(x_1, x_2) = x_1^T x_2$ is a kernel because it is the scalar product of the input vectors. The constant function $k_c(x_1, x_2) = a_0 > 0$ is a kernel because we can define the feature map $p(x) = \sqrt{a_0}$ and obtain this kernel by calculating the scalar product in feature space $\phi(x_1) = \sqrt{a_0} = a_0$. Overall, k is a kernel since it is built up of sums and products of kernels and multiplication with non-negative scalars.

Email: tutorcs@163.com

Problem 11: Find the feature transformation $\phi(x)$ corresponding to the kernel

$$QQ(x_1, \sqrt{2}) 4 9 3 8 9 4 1 \sqrt{x} 6 x_2 \in (0, 1).$$

Hint: Consider an infinite-dimensional feature space and infinite series.

We use the geometric series to transform k:

$$k(x_1, x_2) = \frac{1}{1 - x_1 x_2} = \sum_{i=0}^{\infty} x_1^i x_2^i = \phi(x_1)^T \phi(x_2),$$

with the feature transformation

$$\phi(x) = (1, x, x^2, x^3, x^4, \dots)^T$$
.
